

## Quick Sheet MN: Everbridge Mobile Manager and Mobile Member Applications

### Mobile Manager (left) vs. Mobile Member (right)

Everbridge has two applications, Mobile Manager and Mobile Member. Each application is available for download in both the Google Play Store and Apple App Store for free.

The Manager application is intended for use by administrators and message senders within your organization. The application is designed so that you can send a notification on the go.

The Mobile Member application is a two way communication portal that allows your recipients to send and receive messages through the Everbridge system. The recipient may log into the application using the same username and password that they use with the member portal.

### Using Mobile Manager

The Mobile Manager application replicates the basic functionality of the full Mass Notification web portal. Through the application you can create and send a new notification, send messages using a notification template that has a message and contacts and create and import message templates. The application also has reporting features built in that allow for follow up notifications and rebroadcasts.

### Using Mobile Member

The Mobile Member application allows you to confirm and send an additional message. To add an account to the mobile member you must register with the Member Portal and create a user name and password. The same user name and password will work with the recipient application. In addition to sending a text based message you can take a photo and include your geo location using the GPS services on your mobile device. The Member application is another path that can be reached with an internet connection when others may be unreliable. It is the fastest contact path because it goes directly from the Everbridge server to the device being targeted.
